

SOAR Playbook Documentation

1. Introduction

This document outlines a SOAR playbook for automating the detection, analysis, and response to phishing incidents to improve SOC efficiency and reduce response time.

2.Objective

To automate the handling of phishing alerts by validating indicators, blocking malicious sources, and creating incident records with minimal manual intervention.

3.Tools Used

TheHive

VirusTotal

Wazuh

4.Use Cases

A phishing email is detected containing a suspicious IP address 10.0.0.15.

The system should automatically verify the indicator and take response actions.

5.Playbook Workflow

Workflow Steps:

1. Receive alert from Wazuh
 2. Extract IP 10.0.2.15 from alert
 3. Check reputation using VirusTotal
 4. IF malicious:
 - Block IP using firewall/CrowdStrick
 - Create incident in TheHive
 - ELSE:
 - Mark as false positive
 5. Notify SOC analyst
 6. Playbook Logic (Decision-Based)
 - IF reputation score = malicious
 - THEN block IP and create incident
 - ELSE
 - Close alert as benign
-

7. Playbook Execution Table

Playbook Step	Status	Notes
Alert Received	Success	Phishing alert detected
Extract Indicator	Success	IP extracted from email
Reputation check	Success	Marked as malicious
IP block	Success	IP blocked via firewall
Create Incident	Success	Case created in TheHive

8. Testing the Playbook

A simulated phishing alert was generated in Wazuh.

The playbook successfully extracted the IP, validated it using VirusTotal, blocked the IP, and created an incident in TheHive.

9. Challenges / Limitations

- False positives from threat intelligence sources
- Dependency on external API availability (VirusTotal)
- Requires proper integration between tools

10. Conclusion

The SOAR playbook effectively automates phishing response, improving detection speed and reducing analyst workload while maintaining consistent incident handling.
